redefine
recognition

Parcel, Letter, and Flat Sortation

Experience higher accuracy in reading addresses and make the most of how parcels, letters and flats are sorted in order to minimize processing costs and maximize mail discounts.

- **AddressScript®** reads addresses on letters, flats and parcels, enabling automation of one of the most vital challenges of the mail industry. It reads any character type - cursive, handprint and machine print - in any combination to provide a single recognition solution.
- **AddressParcel Plus®** allows postal and shipping agencies to locate and read greater volumes of parcel and bundle addresses more accurately and quickly, so they can truly reap the benefits of an automated environment. Based on our *AddressScript®* technology, *AddressParcel Plus* recognizes destination addresses on packages with the highest read rates available in the industry.

Incoming Mail Sortation

Reduce labor costs and get mail to its destination faster by applying the same recognition technologies used by commercial mailers and postal operators to incoming mail.

- **InMaiRouter®** automatically reads and enables sorting of the entire spectrum of incoming mail, including letters and postcards in facilities that range from high-volume postal mail processing centers to mailrooms of large corporate organizations.

Parascript automates domestic and international mail processing with a single engine that recognizes machine print, handprint and cursive.

Capture-to-Process

Parascript technology delivers capture-to-process automation that allows for forms and transaction processing directly from the mailroom.

- **FormXtra SDK®** sets new standards for accuracy, flexibility and speed. By combining the power of our flagship recognition software with a form definition module, we enable solution providers to easily integrate forms processing into their solutions and propel bottom-line impact by putting forms data extraction into production sooner. *FormXtra* SDK increases productivity, captures more information and reduces data entry costs.

Vote by Mail

Efficiently verify and sort incoming vote-by-mail envelopes. Parascript's award-winning signature verification technology locates signatures on envelope images and verifies signature authenticity on absentee ballots.

- **SignatureXpert®** minimizes the need for visual sampling with 100% signature validation on all documents. Verify vote by mail signatures by comparing signatures from ballot envelopes to signatures from the voter registration system or absentee ballot application. Parascript provides the highest degree of accuracy for any application that needs to verify signatures.
